

AI Tool Usage & Integrity Disclosure

Purpose of this document

This statement discloses, specifically and honestly, where and how AI assistance (Claude, Anthropic) was used in producing this submission package. It is written to accompany — not replace — an actual AI-detection scan of the final manuscript text (see “What still needs to happen” below).

What AI assistance was used for

Task	AI involvement
Experimental design, notebook code, model training, all reported numbers (Tables III–IX, confidence intervals, p-values)	None. All experiments were run by the author in their own notebook (<code>alzheimersupdate_version_1.ipynb</code>), on their own machine/environment (Table III of the paper), against the author’s own dataset copy.
Literature search for related work	AI-assisted. Claude was given seven candidate papers (uploaded by the author) and asked to extract citation-relevant content (titles, authors, methods, reported results) to inform the Related Work section and the 20-study comparison table.
Prose drafting and editing (Introduction, Related Work, Gaps, Threats to Validity, Conclusion)	AI-assisted. Claude drafted and revised prose based on the author’s original manuscript content and the author’s verified experimental results; the author is responsible for reviewing and approving all resulting text.
LaTeX structuring (architecture section restructuring, new tables, bibliography formatting)	AI-assisted. Claude restructured the existing LaTeX source and added new tables/citations; underlying data and claims were not altered.
AI review report (<code>02_ai_review_report/</code>) and response to review (<code>03_response_to_review/</code>)	Fully AI-generated , by explicit design — this is an “AI review” exercise per the assignment rubric, not a claim that a human referee reviewed this paper.
Reproducibility package files (<code>06_reproducibility_package/</code>)	AI-generated documentation (README, requirements, run instructions), populated with environment details taken directly from the paper’s own Table III (not invented).
Architecture diagram (Fig. 2, <code>make_architecture_fig.py</code>)	AI-generated script producing a schematic diagram from the paper’s own stage descriptions — not a plot of experimental results, so it does not encode any data-derived claims.

What was NOT AI-generated

- The underlying experiments, the dataset, the notebook’s model training and evaluation logic, and every reported quantitative result.
- The original manuscript’s core scientific argument and its self-critical documentation of a prior AI-drafted draft’s fabricated content (which the author caught and removed before this AI-assisted revision cycle even began).

What still needs to happen (author action required)

This document is not itself an AI-detection report, and it should not be treated as satisfying an “AI-detection / integrity report” requirement on its own. A genuine AI-detection score has to

come from actually running the final manuscript text through a real detection tool — this disclosure cannot substitute for that, and generating a fabricated percentage or verdict here would defeat the entire purpose of an integrity criterion.

To complete this criterion, the author should:

1. Run the final manuscript text (`04_final_paper/main.tex`, converted to plain text or PDF) through your institution's actual AI-detection tool (e.g., Turnitin, GPTZero, Copyleaks, Originality.ai — whichever your institution mandates).
2. Save the tool's own report/output (its PDF or screenshot, with its score and methodology as generated by that tool) into this folder as `AI_Detection_Report.pdf`.
3. Given the disclosure above, expect — and do not be alarmed by — a nontrivial AI-generated-text score on prose sections. The honest and defensible position is transparency about *why* (this table), not a clean scan achieved by evading detection.

Statement

The author affirms that this disclosure accurately reflects the actual division of labor between human and AI contribution in this submission, to the best of their knowledge, and has not altered or minimized the extent of AI involvement described above.
